

SHIELDED LABEL PACKAGE AND METHOD OF MAKING THE SAME

ABSTRACT OF THE DISCLOSURE

[0023] A plurality of die cut labels formed on a label substrate attached on the surface of a carrier for the die label substrate. A protective cover, preferably but not necessarily formed of transparent material, is adhesively secured over the die cut label substrate by way of a dry peel adhesive deposited on the surface of the die cut label substrate. The dry peel adhesive is such that when the protective cover is removed from the die cut label substrate, no tacky adhesive residue remains on the protective cover or the label substrate.
